User Profile

09/28/2026 9:51 am MDT

The User Profile allows you to set specific values only for your user account, such as signature, landing page options, email notification and warnings messages.

To get here:

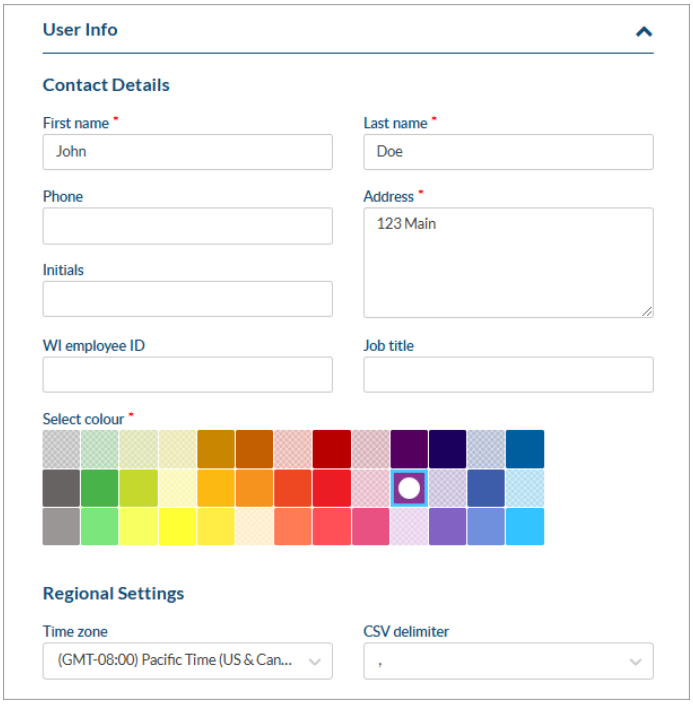

Profile

User Info

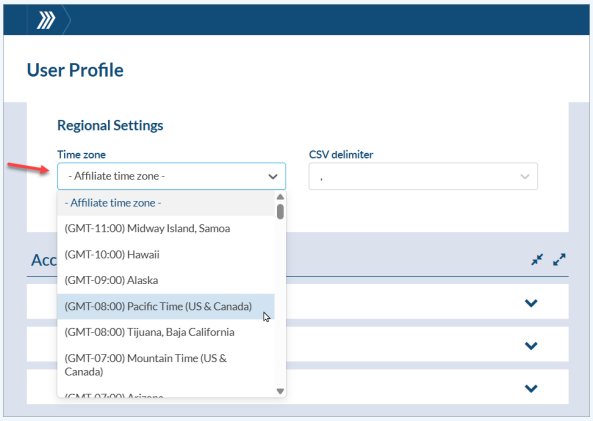

This tab contains basic information like your name, phone number, and address. All users must represent a single person.

Select colour: All markups by this user will appear in the selected colour. The checkered squares indicate that the colour is in use by another user.

Any data fields with an asterisk ('*') are mandatory.

By default, the user's selected time zone will match the time zone set at Admin > General (i.e., instance time zone). If using custom affiliate admin settings, the user's selected time zone will default to the time zone set for their primary affiliate. In either case, the user's selected time zone can be adjusted if desired.

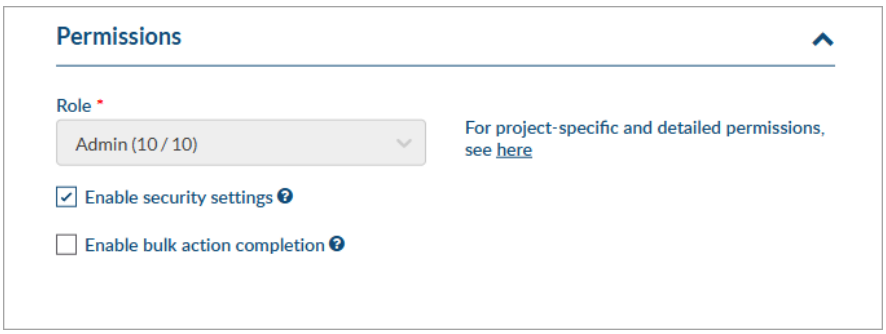

Access

Permissions

Your administrator will have defined your role. For additional information on roles, check here: User Roles.

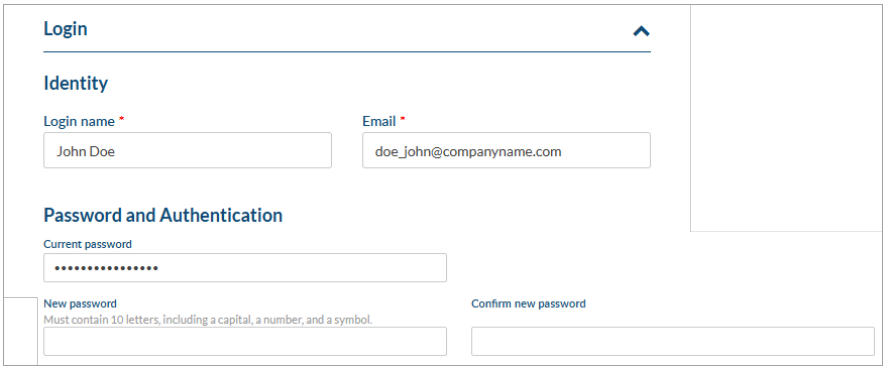

Access to project-specific and detailed permissions can also be found here.

Login

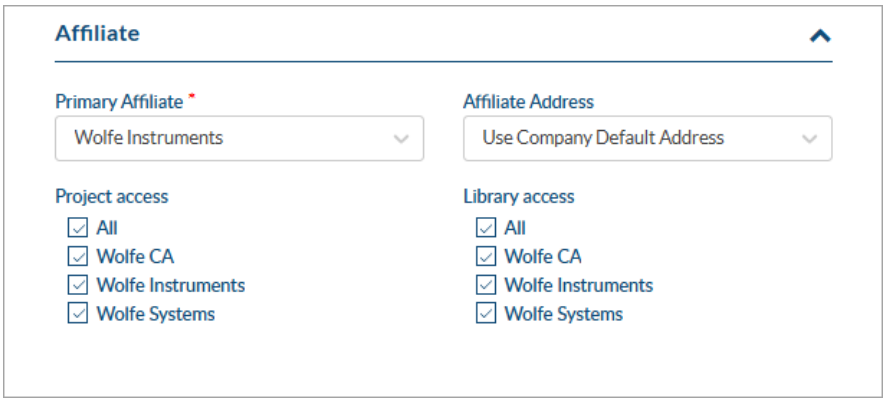

The users email address is the login value for system access.

Users may update/change their passwords from here.

Affiliate

For customers using Affiliates in DocBoss, by default, new users will get full access (still limited by their role type) to all affiliates that the user creating them has access to. The option to limit access to specific affiliates is only available under the **Edit** screen (available only after a new user is saved).

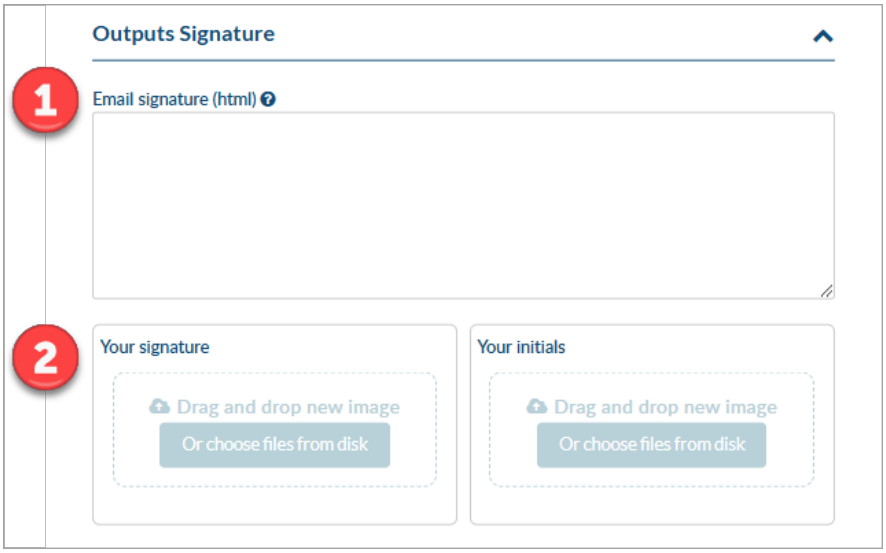

For more information, see Enable Affiliate Permissions for a User.

Signature and Certificates

Outputs Signature

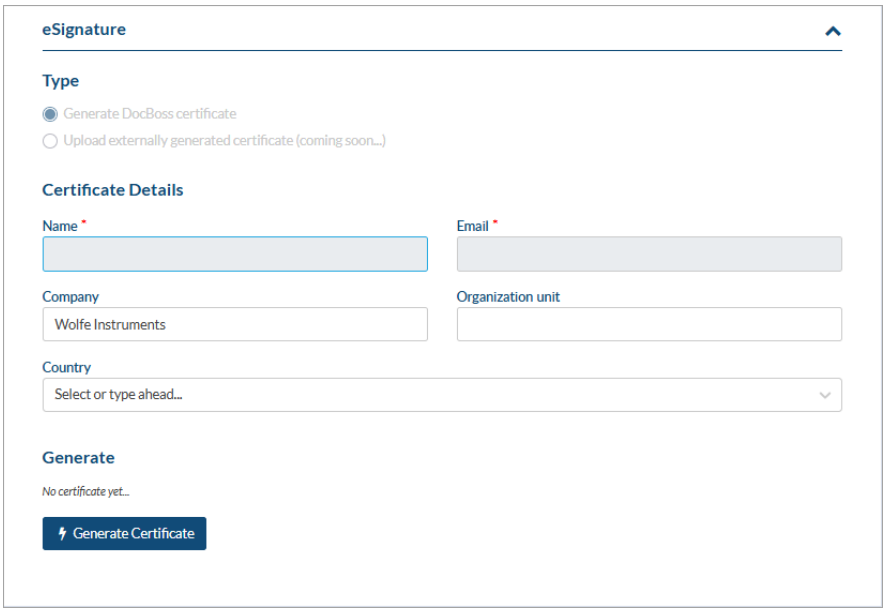

Sometimes customers request signatures or handwritten initials to be included on their cover sheets. Once uploaded, these files can be used on all the projects where this is required.

To create the files, you can either (1) bring over an HTML signature, or (2) simply sign a piece of paper, take a photo of it, and upload by dragging and dropping the images in the applicable field.

eSignature

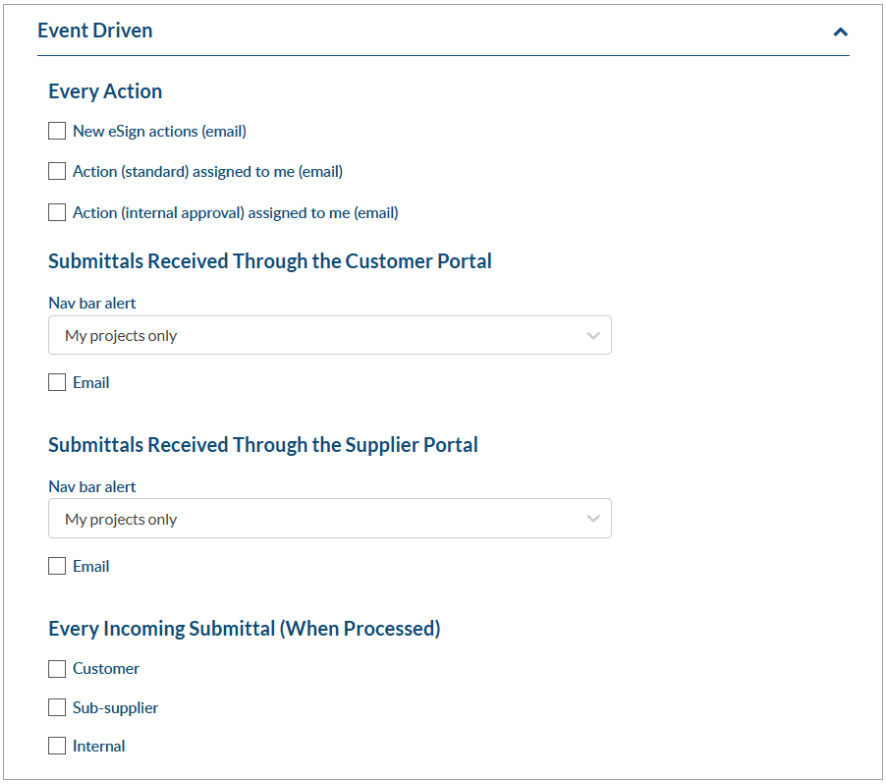

eSignatures allow you to apply a stamp of your signature onto documents. You can configure your eSignature certificate from here.

Notifications

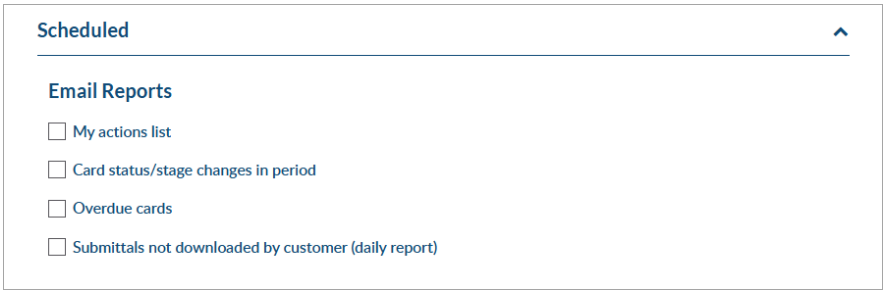

Event Driven

Enable/disable notifications resulting from specific triggers. For details, see this article: Automated email reports from user profile.

Scheduled

Enable/disable scheduled/recurring notifications. For more details, see this article: Automated email reports from user profile.

Note for Admin users: *to make changes to the overdue cards report, see Edit the Default Overdue Cards Report.*

Defaults

Edit the behavior for various system settings. In many cases, these settings are defaulted from your role, but can be overridden in this section.

Interface

Project Dashboard

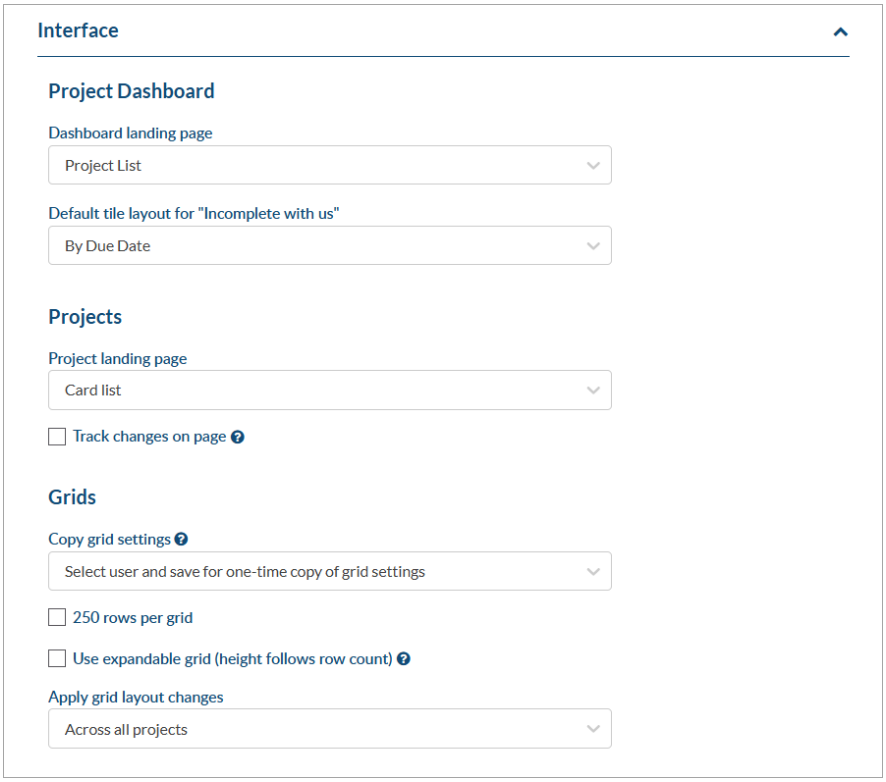

- **Dashboard landing page**: You can choose the first page that you want to see on your dashboard.
- **Default tile layout for "Incomplete with us"**: You can choose whether to see these tiles by due date or by location.
    - *For more information about "Incomplete with us" in your project dashboard click go to Project Dashboard Overview and Tile Layout.*

Projects

- **Project landing page:** Allows you to choose the first screen you see when accessing a project.
- **Track changes on page:** Keeps track of your changes in real-time, warning you if you try to leave the page without saving.

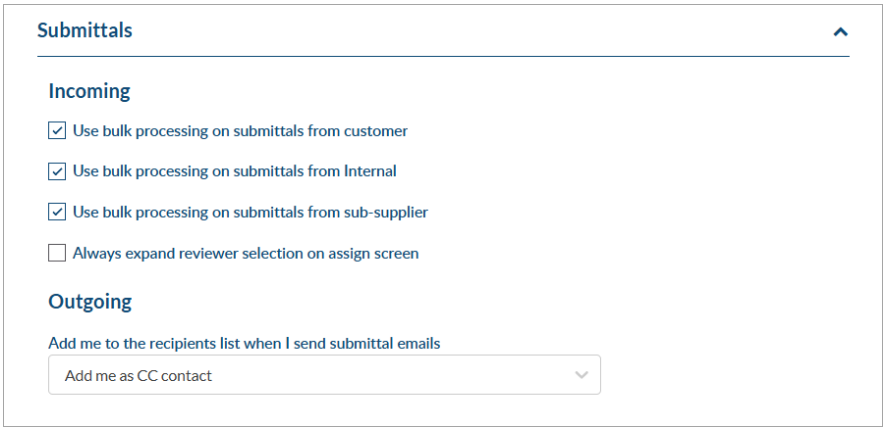

Grids

- **Copy grid settings:** It is possible to copy all grid settings from another user. Generally only used when launching a new user.
- **250 rows per grid:** By default, the system shows a maximum of 100 rows per grid. This is generally to make page loading faster. The option exists to display up to 250 rows, but loading time may increase.
- **Use expandable grid (height follows row count):** The default card list grid is fixed to the viewport height with horizontal scrolling, loading records in paginated sets. Enabling this option restores the classic layout, where the grid height expands to follow the configured row count and can extend beyond the viewport, requiring full-page vertical scroll. The tradeoff is loss of the horizontal scroll available in the default view
- **Apply grid layout changes:** Choose whether to apply card list layout changes across all projects or only to individual projects.

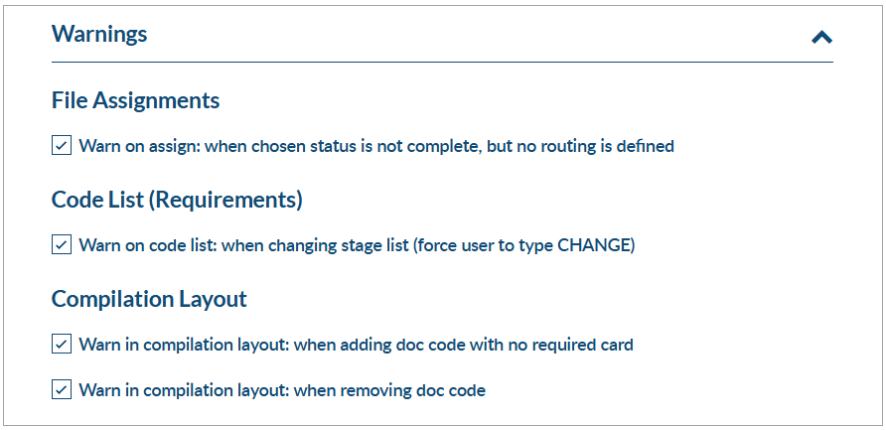

Submittals

Choose to enable bulk processing for incoming documents (by default), always enable reviewer selection upon assigning a file to a card, and/or update whether you receive submittal emails sent through DocBoss.

Warnings

Warnings are pop ups that show up in DocBoss. You may choose to disable some standard system warnings if you prefer.

Learning Mode

Learning mode is a quick and effective way to find information pertinent to the area of DocBoss you are in. You can choose to enable or disable the icons from appearing on your account.

AI Suggestions

Enabling AI suggestions provides you with access to AI-powered tools across the system.
