

Card State

04/03/2025 9:12 am MDT

DocBoss maintains a **state** for every **locked** card. Cards become locked if ANY of the following actions have been performed:

- The card has been submitted to the customer (tracked separately also)
- A system generated INDEX has been submitted to the customer
- A user has manually locked the cards by clicking on the lock icon beside the project name

Below is a list of the default values. This list is configurable from **Project Menu > Set Up > Card States**. The state values can also be configured at the company level by navigating to **System Menu > Lists > Companies > [Company Name] > Company Menu > Card States**.

Within the project:

The screenshot shows the 'Card States' configuration page within a project menu. The left sidebar contains a 'Card States' table with columns 'State' and 'Description'. The main content area has a 'Set Up' section with a 'Card States' link highlighted. The table below shows the default state values.

State	Description
A	The document is valid and active.
C	The document has never been submitted.
S	The document has been submitted previously.
SC	The document has never been submitted.
V	The document has been submitted previously.
Z	Document has never been required.

Within the company's profile:

The screenshot shows the 'Card States' configuration page within a company profile. The left sidebar contains a 'Card States' table with columns 'State', 'State Description', and 'Output for Index'. The main content area has a 'Card States' link highlighted. The table below shows the default state values.

State	State Description	Output for Index
A	The document is valid and active.	
C	The document has never been submitted.	
S	The document has been submitted previously.	
SC	The document has never been submitted.	
V	The document has been submitted previously.	
Z	Document has never been required.	

The state descriptions define specific system actions/occurrences and are therefore **not** editable. However, if you would like the same state value to appear for different occurrences, you may choose to set multiple lines to the same value.

State description

Card States

State ↑	State Description
A	The document is valid and active.
C	The document has never been submitted and is no longer required.
S	The document has been submitted previously, but the information from original document is now found in another document.
SC	The document has never been submitted, and the information is now included in another document.
V	The document has been submitted previously, but the information on the document is no longer valid.
Z	Document has never been required.

Below is a description of the actions required to move a card into any of the states you see above.

Statuses related to VOID:

- Default C (for Cancelled)
 - The card was required.
 - Then card was locked (**but NOT submitted**).
 - Then card changed to not required.
- Default V (for Void)
 - Card was required
 - Card was locked (**AND submitted to customer**)
 - Then card changed to not required

Statuses related to SUPERSEDE or MERGE then VOID:

- Default SC (for Superseded and Cancelled):
 - Document is required
 - Card is locked (**but NOT submitted to customer**)
 - Card was merged into another card
- Default S (for Superseded):
 - Document is required
 - Card is locked (**AND was submitted to customer**)
 - Card was merged into another card

Other:

- Default A (for Active)
 - The card is **required** for the project and does not meet any of the other conditions.
 - Can be locked or unlocked
 - Default Z:
 - Card is **not required**
 - Card is **not locked**
-
