Keep all your documents together

Attach native files, comment files, and support files alongside each document—meeting every customer's unique requirements.

What are native files?

A **native file** (or **secondary file** in DocBoss) is the version of a document in a secondary file format, typically the format of the program the file was created in.

Upload native and/or comment files

Managing and providing documents in your customer's preferred format is simple.

Track history of all files

Version history is saved automatically for all files, including the native and comment files.

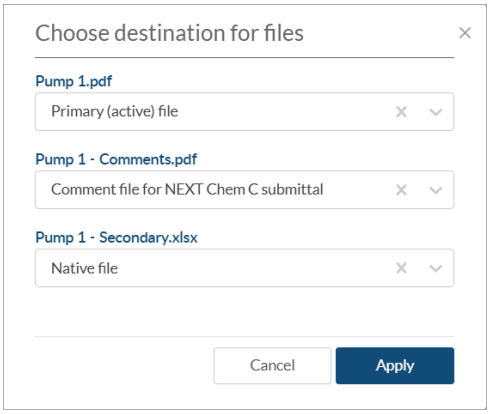

Manage comment files

Did your customer provide a comment page in their submittal? Identify and manage it with ease.

Bulk process

Upload and assign native files to cards in bulk through automatic matching.

Assign & manage all files in one place

Submit documentation *their* way

Managing and providing documents to your customer's preferred format is simple.

Include comments on submittal

Choose whether you want to include comment pages when you make a submittal, or whether you want DocBoss to automatically remove them.

Include comments in databook

Should comment pages be included in the final data book? No problem. You can choose whether you want to include them in the book, or leave them out.

Different files, different names

Set different file naming patterns for the main (active) file, the native file, and comment files, aligning with your customer's requirements.

Send large files

If you're submitting large files to your customer, we've got you covered. DocBoss supports files up to 2GB in size, and you can choose how they're sent (directly in email, and/or via secure link).
