

# Custom Field ID Number Identification

09/04/2025 10:17 am MDT

To generate data from a custom field on a template, the custom field ID number will need to be determined. To identify the ID number, navigate to **Project Menu > Set Up > Project Template**.

Once on the project template, navigate to the appropriate custom field type (e.g., Doc Code/Card Fields, Equipment Fields, etc.). In the grid, find the field in question and identify the value in the variable/field column. The numerical value is considered the ID number.

**Example:** The ID number of the "Description" doc code/card field is 3. To show this value on a document cover page, use the <Document\_CustFieldX> variable and update the "X" to the ID number (<Document\_CustField3>)
