

# Start a Different Stage List (On Save)

01/21/2026 2:24 pm MST

Sometimes, the full workflow required for a document is unknown OR the workflow takes a different path than what was set up initially. In cases like this, a different stage list can be selected after completion of the current stage.

Once a [complete status](#) is assigned to a card (i.e., completing the current stage), a different stage list can be selected by checking the "**Start a different stage list (on save)**" box and choosing the appropriate stage list from the drop-down. Once saved, the card will move to the first stage of the newly selected stage list (and skip any further workflow established on the previously-selected stage list, if applicable).

The screenshot shows the 'Status & Routing' section of a form. It includes a 'Stage List' dropdown menu currently set to 'IFR', with a 'Select different stage list' link. Below this is a 'Stage List Workflow' section with a 'Current Stage' box showing 'IFR' and a 'Customer' link. The 'Doc Status' dropdown is set to '1 - Approved'. A red circle with the number '1' points to the 'Start a different stage list (on save)' checkbox, which is checked. A red circle with the number '2' points to the dropdown arrow of the 'Select or type ahead...' field below the checkbox. The 'Add to Ad-Hoc' checkbox is also visible.

If there are many stage lists available, begin typing the name to filter the list.

## Use case

This feature is particularly useful in cases where the full workflow required for a document is unknown (i.e., a [sequential \(multi-stage\) stage list](#) (with automated workflow progression) cannot be established).

In this scenario, multiple **single-stage stage lists** can be created and the appropriate next stage can be chosen following the completion of the current stage. See this article for an example: [Single Stage Workflow \(Example\)](#).
