

Using "Add Doc Code to Project" API Call

01/21/2026 3:40 pm MST

The **Add Doc Code to Project** call can be used to add doc codes to the code list on a pre-existing project in DocBoss.

The doc codes than can be added must **already exist** on the company doc code list selected for use on the project. **New doc codes cannot be created using this call.**

Doc Code and Status Lists

Doc Code Lists

Use code lists from

☒ Chem C lists

☐ Omega CAN lists

☐ ABC lists

☒ Enable mapping to internal codes

☐ Force mapping on code list

Doc code list * + Add

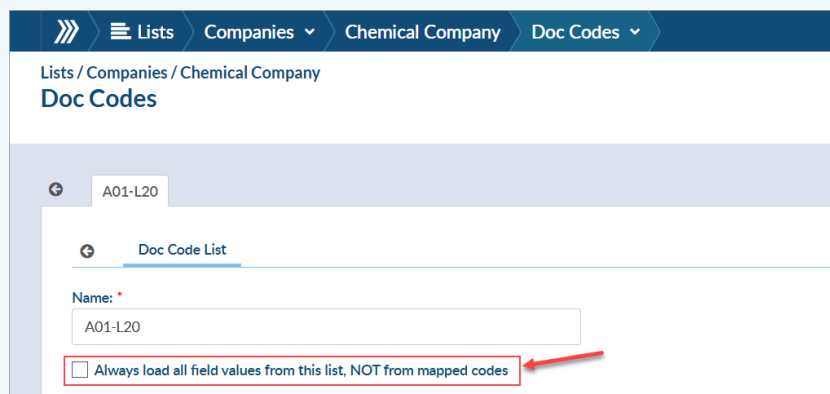

A01-L20 x v

When a doc code is added, the settings configured on the company list (e.g., doc code type, stage list, etc.) will be inherited into the project. However, the **level** will not be inherited and will only be set if the parameter is defined from the API call (via the "level" parameter).

If mapping to internal codes is enabled on the project and the company doc code is mapped to an internal code, the internal code will be inherited into the project, too.

Importantly, if the option to "Always load all field values from this list, NOT from mapped codes" is **unchecked** on the company doc code list, the settings configured on the **internal code** will be inherited into the project **INSTEAD OF** the settings configured on the company list.
